## Notes

1. The standard property changes of formation  $\Delta H_{f298}^\circ$  and  $\Delta G_{f298}^\circ$  are the changes occurring when 1 mol of the listed compound is formed from its elements with each substance in its standard state at 298.15 K (25°C).
2. Standard states: (a) Gases (g): pure ideal gas at 1 bar and 25°C. (b) Liquids (l) and solids (s): pure substance at 1 bar and 25°C. (c) Solutes in aqueous solution (aq): Hypothetical ideal 1-molal solution of solute in water at 1 bar and 25°C.

### Notes

1. The standard property changes of formation  $\Delta H_{f298}^{\circ}$  and  $\Delta G_{f298}^{\circ}$  are the changes occurring when 1 mol of the listed compound is formed from its elements with each substance in its standard state at 298.15 K (25°C), except as noted in Note 2.
2. Conventions used in this table are that  $\Delta G_{f298}^{\circ} = \Delta H_{f298}^{\circ} = 0$  for H<sup>+</sup> and for oxidized nicotinamide-adenine dinucleotide (NAD<sub>ox</sub><sup>−</sup>). For the latter, and other NAD species, no molecular formula is provided because their properties are computed relative to this convention rather than relative to the elements in their standard states.
